## AutoMiningToken Ecosystem

The ecosystem is formed by a group of Bitcoin miners, whose facilities are managed by the Natural Environment Group, a Paraguayan company based in Asunción, and a Token called Auto Mining Token (AMT), whose purpose will be to identify which wallet will benefit from the bitcoins generated and in what quantity. The token will work as a share of a company - the total number of Tokens issued represents the referred total of shares.

Auto Mining Token (AMT) or automatic mining token is the direct representation of the associated mining production. It is a BSC (Binance Smart Chain) network's token, with a total supply of 100,000,000 with no transaction fees, which means no additional commissions. The AMT, in addition to contributing to the total generated, will have real backing in Bitcoins into a central wallet called Warranty Vault. This wallet, managed automatically by a Smart Contract, will have an initial deposit of 30 bitcoins provided by the Mining group and the managing company. In this warranty wallet, BTC withdrawals are only allowed through exchange with AMTs - the owners of these Bitcoins are the proportional owners of the AMTs. In this guarantee wallet (Warranty Vault), the 35% of bitcoins generated by the ecosystem will be deposited daily, and another 35% will be automatically sent to each wallet that contains AMT based on the capital contributed.

The initial and subsequent issuances will be based on the amount of tera hashes invested into the ecosystem. Tera hash refers to the measure of the computing power of the IT equipment involved in the process. This power is directly proportional to the number of bitcoins that a mining machine can generate. The greater the number of tera hashes, the greater the number of bitcoins generated by the ecosystem. The AMT issued will be directly linked to the total production, in order to ensure a fairly consistent return to the token holder.

In the first AMT issue, for each tera hash there will be 625 AMT - for example, if a 100 TH/s (tera hash x second) machine is provided, there will be 62,500 AMT. This rate may be modified at the ecosystem's convenience for subsequent issues.

## Tokenomics, token economics.

The issued AMTs will be split between 1) The miner providing the terahashes and backing bitcoins, 2) The investors who purchase AMT on the open market, and 3) The project managers.

Miners will receive 75% of the tokens. Investors will be able to purchase 20% of the tokens that will be available and put up for sale on the DEFI platform as well as on PancakeSwap. The project management will hold 5% of the issued tokens. The system will support a maximum total issuance of 100 million AMT and will have a token “burn” system. We tend to promote a long-term scarcity that will result in the appreciation of the AMT. This is due to the fact that every time token holders wish to exchange their tokens for their Bitcoins stored in the Warranty Vault, the respective AMT will be burned and automatically withdrawn from circulation. Those in the community who keep their AMT will benefit from an increase in their profits, as the Bitcoins generated will be distributed among a smaller number of “partners”, which are those who hold AMT in their wallets.

## Business plan and Bitcoin flow

The business plan will be to reinvest in the project the capital generated by the sale of the tokens, these will be sold at a fixed rate of 1 USD = 1 AMT. The total collected will be distributed 80/10/10.

80% of the resources will be allocated to the purchase of new IT equipment. 10% of the revenue will be used to increase the bitcoin backing (Warranty Vault) of the issued tokens, which initially is 30 Bitcoins, and the remaining 10% of the revenue will be used to increase the liquidity pool\*.

In this way, the whole ecosystem can benefit from an increase in productivity, which will be distributed between all the tokens, and both the miner and the investor who acquired their AMTs in the market will receive a greater number of bitcoins as soon as the new equipment is connected.

The flow of bitcoins generated through mining will be divided

into 3 wallets: COSTS, DIRECT PROFIT and WARRANTY VAULT.

The first one (costs) will be used to cover electricity expenses, salaries, taxes, etc. with approximately 30% (it may vary depending on the specific ecosystem profitability, network difficulty, bitcoin price, etc.). The other decentralized wallets are programmed with Smart Contracts. The Direct Profit wallet (35%) will send daily to each wallet that holds AMT a number of bitcoins produced in proportion to the number of AMT that currently exists in that wallet. And the WARRANTY WALLET (35%), as we have already mentioned, will receive daily deposits from the ecosystem which will be related to the backing or collateral in bitcoins of all the AMTs in circulation. Therefore, AMT works as a “synthetic token” of Bitcoin, that is, it is a token issued with real Bitcoin backing, 100% convertible (“exchangeable”), managed by a smart contract, and whose backing increases every day due to the Bitcoins generated through mining. In order to withdraw Bitcoins from the Warranty Vault, it is mandatory to hand over the referred AMT. No one can withdraw these assets without handing over the AMT (remember that the number of AMTs is limited to 100,000,000). Neither the project’s developers nor the managers will have access to these assets unless they hand over their AMT, which will be automatically withdrawn from circulation. The AMT counts with a deflationary model, guaranteed by a public and duly audited Smart Contract.

## Liquidity Pool

Online decentralized markets imply that token trades are carried out by automatic smart contracts, for which external liquidity is required. Whoever contributes to this liquidity will be rewarded by the system with 0.17% of the value of each transaction (current values of Pancakeswap, that charges 0.25% and keeps 0.08%).

The AMT Group will create a liquidity pool at <https://pancakeswap.finance/>, which means that they will contribute with 1,000,000 AMT and 1,000,000 USD in Bitcoins, so the initial value in the liquidity pool will be 1 AMT = 1 USDT. This contributed liquidity will be blocked for 2 years, and any other AMT holder can join the pool, providing liquidity and receiving the corre-

sponding benefits. This ensures that there is a market for those who are dedicated to trading tokens and generating profits from their purchases and sales. Although this is not the main concept behind the creation of the AMT as it leads to a generation of dividends in Bitcoins by itself, the user is not prevented from being able to trade it, but is favored, since with AMT there are no commissions per transaction registered in the token. This also allows PancakeSwap to place limit orders, which means placing a sell order at the desired price and once the asset reaches that value, the sale would be made automatically, greatly benefiting the user.

## **Another way to earn income with AMT**

With AMT, as with any token, there is the possibility of earning passive income by providing liquidity to the PancakeSwap pool, as already mentioned. But due to the nature of the process, once liquidity is provided, the system “removes” the contributed tokens from your wallet and leaves them locked in the pool, controlled by a smart contract. For this reason, the system would stop paying the Bitcoins that belong to the user, as it would not “find” the AMT in their wallet when daily balance checks are carried out. However, the AMT developer team designed their own system on the official website to provide liquidity without losing these benefits - the ingenious system allows the user to have 2 passive income earning methods acting simultaneously. This is because the system will recognize the user who has provided liquidity and will also take them into account to pay the inherent benefits of their AMT.

While these tokens are locked, 0.25% will be charged for each transaction, of which PancakeSwap returns 0.17% to the liquidity pool. Therefore, when the decision is made to remove this contributed liquidity, the corresponding tokens will be withdrawn, including the tokens generated by transaction charges. It should be noted that if the user makes the liquidity contribution directly on the PancakeSwap page and not through our official website, they will not receive the bitcoin benefits that belong to them, as their AMTs won't be in their wallet.

## How to acquire AMT?

The tokens will be for sale on 2 websites on the market, the first one being our own platform, the AutoMiningToken Marketplace, on our official website [www.autominingtoken.com](http://www.autominingtoken.com) and they will also be available at [www.pancakeswap.finance](http://www.pancakeswap.finance). Both markets are decentralized, that is, they are managed by smart contracts in which we must connect our Metamask wallet (download from [www.metamask.io](http://www.metamask.io)), allowing us to trade directly from our wallet. By clicking on “exchange” or “buy”, the desired amount will be transferred to the platform and the corresponding AMT amount will be received immediately. There will be 2 types of sale - a sale at a fixed price (limit order) of 1 dollar per token, which can be purchased in any currency by anyone who operates on the platform until the tokens available for this option run out. In addition, we have a second sale option, in which tokens can be accessed in the liquidity pool (another section within the same platform). The difference is that the price in this liquidity pool is calculated according to the ratio of existing tokens. For example: if there are 1 million AMTs and 1 million USD, the price is 1:1, but after making an AMT purchase in this pool, the AMT value increases and the USD value decreases, so a new price is set. In this case, the next user willing to buy AMT will pay a higher price, because the purchase of AMT caused its price to rise automatically, managed by the internal algorithm of the liquidity pool. The opposite is also true: in the case of an AMT sale, its price automatically drops. The ratio between one token and the other will give us the value of the AMT. Presumably, no one can make a purchase using this option until the AMTs put up for sale at a fixed price run out, as any purchase in this pool will make each AMT pricier than 1 dollar.

## OK, I already have my AMTs, how do I get my

There are two ways to get your Bitcoins, the first being automatically in your wallet. Your AMTs report to the system that your wallet is the beneficiary of the Bitcoins that are generated. Every day the system records all the balances of all the wallets that hold AMTs, and it will calculate which percentage of the total generat-

ed should be given to each user. On the website you will be able to check your new balance available in Bitcoins and you will have the “charge” button in order for the payment to be made to your wallet. Although this allocation is automatic, the actual collection of the amounts must be done manually by the user. As all transactions result in commission charges by the network, all transaction fees must be manually approved by the user and since this charge is made in BNB, you must have a BNB balance in your wallet.

The second way to receive your bitcoins is in the Warranty Vault. The same amount that is distributed between all the wallets that hold AMT will be sent to the Vault daily. This wallet will work as an automatic “exchange office” for BTC sales (AMT cannot be purchased) in which any user, at any time, can exchange all or part of their AMT for the Bitcoins that belong to them. The exchange rate will be calculated based on the total amount deposited in BTC divided by the total amount issued in AMT. The AMT exchanged will be automatically withdrawn from circulation, they will be “burned”, which means that the shares of each user regarding the total amount in the business will increase. Therefore, they will also receive greater benefits daily.

These two ways of obtaining Bitcoins occur simultaneously, without the need for any procedure or management by the users. Daily, they will receive 50% in their Metamask wallet as their tokens “inform” the system where to send and how much. The other 50% will go into the warranty wallet.

## **Decentralized issuing control**

The AMT will be issued according to the tera hash contribution made by the miner to the ecosystem, through a certified contract with Natural Environment S.A. and the AMT Group. The miner will immediately be the beneficiary of 75% of the tokens issued. Each machine with which the mining company contributes to the ecosystem will allow it to issue a fixed amount of AMTs ensuring sustainability. The precise calculation uses a mathematical complexity that exceeds the purposes of this report but suffice it to say that it will be carefully calculated taking into account profitability

variables for both the miner and the investor, who will be able to acquire the remaining 20% of the tokens (5% will be managed by the AMT Group).

This machine connected to the system will provide bitcoins to all users who hold AMT, so we can conclude that the tokens are now the mining title deeds. The contributing miners have a motivation to keep their tokens - they must preserve them in order to receive their Bitcoins. The AMTs represent the computer equipment that works behind the scenes generating bitcoins, so they have a specific real value - they are not used for payment of commissions nor are they distributed in an uncontrolled way; on the contrary, their issuance is calculated, programmed and approved by the miners' ecosystem, as excessive emissions would decrease the profitability of their own production. In this token issuance model, the miners who contribute with their IT equipment to the ecosystem must approve the issuance of tokens in writing. Thus, there is a decentralized issuing control in a tangible and direct way. However, a DAO (decentralized autonomous organization) system will be implemented, in which the token holders will participate in the management decisions through voting.
